CAT811, CAT812

4-Pin Microprocessor Power Supply Supervisors with Manual Reset

Description

The CAT811 and CAT812 are microprocessor supervisory circuits that monitor power supplies. The CAT811 and CAT812 are direct replacements for the MAX811 and MAX812 in applications operating over the industrial temperature range; both have a manual reset input.

These devices generate a reset signal, which is asserted while the power supply voltage is below a preset threshold level and for at least 140 ms after the power supply level has risen above that level. The underlying floating gate technology, AE^2 used by ON Semiconductor, makes it possible to offer any custom reset threshold value. Seven industry standard threshold levels are offered to support +5.0 V, +3.3 V, +3.0 V and +2.5 V systems.

The CAT811 features a RESET push−pull output (active LOW) and the CAT812 features a RESET push−pull output (active HIGH).

Fast transients on the power supply are ignored and the output is guaranteed to be in the correct state at Vcc levels as low as 1.0 V.

The CAT811/812 are fully specified over the industrial temperature range (−40°C to 85°C) and are available in a compact 4−pin SOT−143 package.

Features

- Precision Monitoring of
  +5.0 V (± 5%, ± 10%, ± 20%),
  +3.3 V (± 5%, ± 10%),
  +3.0 V (± 10%) and
  +2.5 V (± 5%) Power Supplies
- Manual Reset Input
- Offered in Two Output Configurations: CAT811: Active LOW Reset
  CAT812: Active HIGH Reset
- Direct Replacements for the MAX811 and MAX812 in Applications Operating over the Industrial Temperature Range
- Reset Valid down to $V_{CC} = 1.0$ V
- 6 μA Power Supply Current
- Power Supply Transient Immunity
- Available in SOT−143 Packages with Sn or NiPdAu Green Lead Finishes
- Industrial Temperature Range: −40°C to +85°C
- These Devices are Pb−Free, Halogen Free/BFR Free and are RoHS Compliant

Applications

- Computers, Servers, Laptops and Cable Modems
- Wireless Communications
- Embedded Control Systems
- White Goods, Power Meters
- Intelligent Instruments
- PDAs and Handheld Equipment

Table 2. PIN DESCRIPTION

| Pin Number		Pin Name	Description
CAT811	CAT812		
1	1	GND	Ground.
2	–	$\overline{\text{RESET}}$	Active LOW reset. $\overline{\text{RESET}}$ is asserted if V_{CC} falls below the reset threshold and remains low for at least 140 ms after V_{CC} rises above the reset threshold.
–	2	RESET	Active HIGH reset. RESET is asserted if V_{CC} falls below the reset threshold and remains high for at least 140 ms after V_{CC} rises above the reset threshold.
3	3	$\overline{\text{MR}}$	Manual Reset Input. A logic LOW on $\overline{\text{MR}}$ asserts RESET. RESET remains active as long as $\overline{\text{MR}}$ is LOW and for 140 ms after $\overline{\text{MR}}$ returns HIGH. The active low input has an internal 20 kΩ pull–up resistor. The input should be left open if not used.
4	4	V_{CC}	Power supply voltage that is monitored.

DETAILED DESCRIPTION

Reset Timing

The reset signal is asserted LOW for the CAT811 and HIGH for the CAT812 when the power supply voltage falls below the threshold trip voltage and remains asserted for at least 140 ms after the power supply voltage has risen above the threshold.
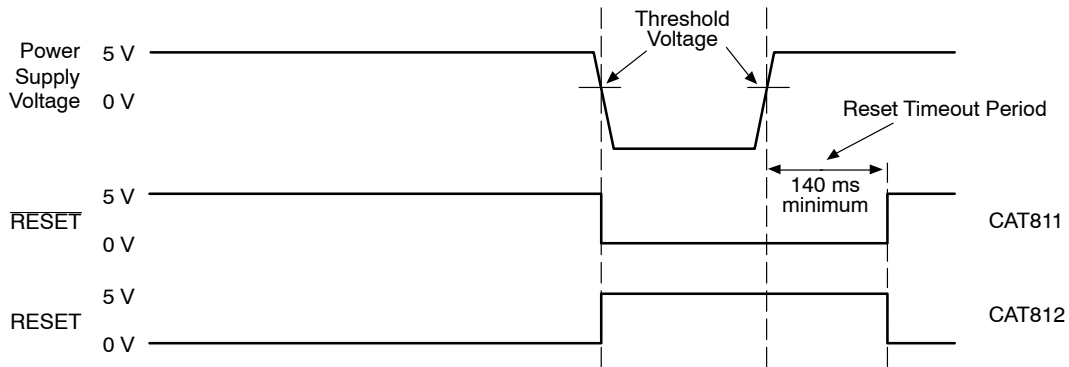

Figure 6. Reset Timing Diagram

V_{CC} Transient Response

The CAT811/812 protect μPs against brownout failure. Short duration transients of 4 μs or less and 100 mV amplitude typically do not cause a false RESET.

Figure 7 shows the maximum pulse duration of negative−going V_{CC} transients that do not cause a reset condition. As the amplitude of the transient goes further below the threshold (increasing $V_{TH} - V_{CC}$), the maximum pulse duration decreases. In this test, the V_{CC} starts from an initial voltage of 0.5 V above the threshold and drops below it by the amplitude of the overdrive voltage ($V_{TH} - V_{CC}$).
Figure 7. Maximum Transient Duration without Causing a Reset Pulse vs. Reset Comparator Overdrive

Valid Reset with V_{CC} under 1.0 V

To ensure that the CAT811 $\overline{RESET}$ pin is in a known state when V_{CC} is under 1.0 V, a 100 kΩ pull−down resistor between $\overline{RESET}$ pin and GND is recommended; the value is not critical. For the CAT812, a pull−up resistor from RESET pin to V_{CC} is needed.

Figure 9. RESET Valid with V_{CC} Under 1.1 V

Bi−directional Reset Pin Interfacing

The CAT811/812 can interface with μP/μC bi−directional reset pins by connecting a 4.7 kΩ resistor in series with the CAT811/812 reset output and the μP/μC bi−directional reset pin.
